

You keep comparing the same options, again and again

8 findings · 12-step checklist · 1 myth · 7 sources · cheatgrid.com

Going over the same options again mostly makes **whichever one you already lean toward** look better. Leaving a close decision unmade for a while is ordinary, not a flaw in how you decide.

THE GOAL

You're reaching a decision you can commit to, not proof that one option wins. Check what's actually changed since your last pass, and if nothing has, decide now.

CHECKLIST

You've just sat back down to go through the same two or three options again.

- ☐ Go into this pass **ready to accept either option**, not hunting for a hidden reason it's better than the other.
- ☐ Check what's changed since you last looked: price, deadline, availability, a new fact. If nothing has, decide now; if something has, weigh it in first.
- ☐ Name, out loud or on paper, which option you leaned toward the last time you looked at this.
- ☐ If a new option occurs to you right now, set it aside instead of looking into it.
- ☐ If you end up with the worse pick, name the worst result and whether it fades quickly or lingers.
- ☐ Pick one concrete method you'll use if the options stay this close, and name it.
- ☐ Set a **specific day and time** you'll decide by, and write it somewhere you'll see it.
- ☐ If somebody else is waiting on this, tell them when you'll have an answer.
- ☐ Name your pick now if you can. If not, return on the day you set and use whatever tie-break method you chose.
- ☐ Say or write the decision as one plain sentence: "I'm going with this one."
- ☐ Do one small, concrete thing right now that **makes this choice harder to walk back**.
- ☐ Write down, in one line, whatever finally decided it, so you can reuse that next time.

THE THREE BIGGEST THINGS

- 1 Running the same comparison again just makes **whichever option you already favor** look better.
- 2 People who chase the **best** option instead of settling for good enough score lower on happiness and higher on regret.
- 3 Putting the decision off for now still counts as making a decision, not as proof your judgment has failed you.

What running the comparison again actually does

KNOW

Running the same comparison again just makes **whichever option you already favor** look better.

As you lean toward an option, its downsides start looking smaller and its upsides bigger, purely from the leaning itself. [Source 1](#)

KNOW

People who chase the **best** option instead of settling for good enough score lower on happiness and higher on regret.

People who scored high on wanting the best showed this same pattern across university students and community adults alike. [Source 2](#)

DON'T

Extra searching can land you an objectively better pick and still leave you feeling worse about it.

The harder you search, the more almost-picked options you have to regret, and that regret is what costs you the satisfaction. [Source 2](#)

Not choosing is a choice too

KNOW

When the choice includes what you already have, waiting isn't neutral. It already means keeping what you have.

In real choices, like which health plan to keep, people stick with the current pick far more often than a fresh comparison would justify. [Source 3](#)

WATCH

The urge to look for another option is a signal that the options in front of you are hard to separate, close enough that neither clearly wins.

People given closely matched options paid to see another far more often than people given a clearly better option. [Source 4](#)

KNOW

Putting the decision off for now still counts as making a decision, not as proof your judgment has failed you.

It doesn't avoid deciding altogether; it sidesteps some of the effort an active choice takes. [Source 7](#)

What happens once you actually commit

DON'T

Keeping the option to change your mind costs you: people who can still swap their pick end up liking it **less** than people whose choice is final.

Once a choice is final, your mind works to make you like it more, and staying reversible switches that process off. [Source 5](#)

KNOW

You're probably overestimating how long a wrong pick will sting. That's still true even after big letdowns like a breakup or missing a promotion.

You don't expect your own mind to make bad feelings fade, so you overestimate how long the sting will last. [Source 6](#)

Myths worth retiring

MYTH

Wait long enough without deciding and you'll eventually just know which one is right.

ACTUALLY

The feeling of finally knowing rarely arrives on its own. What usually happens instead is that people end up **sticking with whatever they already have**, because leaving a decision unmade favors it over anything else. [Source 3](#)
